1	Dynamic 3D diagnosis for unstable shoulders	After a shoulder injury has been treated, patients are often left with a feeling of insecurity. When diagnosing shoulder instabilities, doctors often have to rely on these subjective assessments because conventional imaging methods do not capture the movement of the shoulder. In contrast, the newly developed 4D analysis by Empa researchers goes beyond static imaging. They combine high-precision X-ray videos from two perspectives and use them to reconstruct a four-dimensional motion analysis, in other words, a 3D image while the shoulder is moving. https://www.empa.ch/web/s604/3d-roentgen-dynamik-schulter	Medical and Healthcare Sector	Prof. Dr. Ameet Aiyangar Mechanical Systems Engineering Phone +41 58 765 4508 ameet.aiyangar@empa.ch

Traditional sound absorbers are usually made of bulky materials such as rock wool or melamine foam, however. In order to effectively dampen even low sound frequencies, thick layers of insulation materials are required – which costs space, restricts design and is often simply not even feasible in outdoor areas. Empa researchers have developed an ultra-thin sound absorbers made of mineral gypsum or cement foams. These are just as effective as conventional absorbers, but around four times thinner. The foams can be tuned to specific frequency ranges and are easy to	Construction Sector	Dr. Bart Van Damme Laboratory for Acoustics / Noise Control Phone +41 58 765 4110 bart.vandamme@empa.ch
